Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB seq

The polypeptide is probably a DNA-binding protein probably involved in initiating transcription of the gene for ribosomal RNA 5s and maintaining the stability of transcription of other control genes. The htfIIIA polynucleotides and polypeptides are used to make therapeutic or diagnostic compositions for diseases associated with disorders of transcriptional control, particularly cancer or other inherited diseases. The htfIIIA polynucleotide can also be used to detect anomalies in gene transcription, particularly for diagnosis of inherited disease, also for studying diseases involving htfIIIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim

The polypeptide is probabaly a DNA-binding protein probably involved in initiating transcription of the gene for ribosomal RNA 55 and maintaining the stability of transcription of other control genes. The htfIIA polynucleotides and polypeptides are used to make therapeutic or diagnostic compositions for diseases associated with disorders of transcriptional control, particularly cancer or other inherited diseases. The htfIIIA polynucleotide can also be used to detect anomalies in gene transcription, particularly for diagnosis of inherited disease, also for studying diseases involving hTFIIIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The cocancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention diagnosis and treatment of diseases associated with inappropriate expression. For example, N and P may be used to treat disorders

Additionally. N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC DNA chip analysis as given in the specification, and comparing CC DNA chip analysis as given in the specification, and comparing CC GC, where differential expression level in an unactivated CC Also included are modulating (M2) GA by contacting GC with an agent CC Also included are modulating (M2) GA by contacting GC with an agent CC that alters the expression of at least one gene in Gs; (2) screening (M3) CC for an agent capable of modulating GCA or an inflammation (especially CC chronic) in a tissue, an allergic response in a subject, exposure of a CC subject to a pathogen or sterile inflammatory disease using the CC gene expression profile; (3) detecting (M4) an inflammation (especially CC chronic) in a tissue, an allergic response in a subject, exposure of a compact of expression in a sample of the tissue of gene(s) from Gs, where CC (4) treating (M5) an inflammatory disease, by detecting the level of expression in a subject of expression of gene(s) from Gs, where CC (4) treating (M5) an inflammation (especially chronic) or in a tissue, or sterile inflammatory disease, by contacting a tissue having considered to the same of the tissue of gene(s) from Gs in the tissue. M1 is useful for detecting GCA, M2 is useful for detecting GCA, M2 is useful for ceponse in a subject, exposure of a subject to a pathogen or esponse in a subject, exposure of a subject to a pathogen or esponse in a subject, exposure of a subject to a pathogen or esponse in a subject, exposure of a subject to a pathogen or esponse in a subject, exposure of a subject to a pathogen or sterile of inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile of inflammatory disease, conditions, the printess syndrome, including the printed specification, protozoal infection, fungal infection and M5 is especially chronic in the above conditions. The present conditions of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification
                                                                                                                δÃ

                                                                                                                                                                                                                                                              The sequence encodes human transcription factor-IIIA (hTFIIIA), a CDNA binding protein with 9 zinc finger domains, which is necessary for the initiation of 5S RNA gene transcription, binding to an internal control region of the 5S gene. The coding region internal control region of the 5S gene. The coding region of the gene has been isolated from a human foetal brain cDNA library (CTK7-1), and the 5'-portion of the gene has been isolated by '-rapid amplification of cDNA ends using primers H11-R (AAT14039), H11-H (AAT14041) and AP-2 (AAT14042), complementary to anchor primer AAT14043. Reverse transcription using H-11R is followed by anchor primer ligation and PCR using AP-2 and H11-E, to give a full-length cDNA, OTK7. The gene and its encoded protein may be used in diagnosis, identification or therapy of hereditary diseases such as cancer, or other diseases resulting from abnormal transcriptional control, and to analyse the mechanisms involved in

                                                                                                                                                                                                                                The sequence encodes human transcription factor-IIIA (hTFIIIA),

C a DNA binding protein with 9 zinc finger domains, which is necessary

C for the initiation of 5S RNA gene transcription, binding to an

C internal control region of the 5S gene. A fuller cDNA sequence

with flanking regions is given in AAT14038. A fragment lacking a

5'-portion of the gene has been isolated from a human foetal brain

C cDNA library (OTK7-1), and the 5'-portion of the gene has been

1 solated by 5'-rapid amplification of cDNA ends using primers H11-R

C (AAT14039), H1-E (AAT14040), H1-H (AAT14041) and AP-2 (AAT14042),

C complementary to anchor primer AAT14043. Reverse transcription using

H-11R is followed by anchor primer ligation and PCR using AP-2 and

H1-E, to give a full-length cDNA, OTK7. The gene and its encoded

C protein may be used in diagnosis, identification or therapy of

hereditary diseases such as cancer, or other diseases resulting from

abnormal transcriptional control, and to analyse the mechanisms

The invention relates to 2175 novel human ovarian antigens (ABP41054-CC ABP4328) and to cDNAs encoding them (AB054131-AB056305), and also CC encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen CC recombinant vectors and host cells comprising human ovarian antigen CC recombinant vectors and host cells comprising human ovarian antigen CC reating, prognosing or preventing various ovary and/or breast related CC disorders. Such conditions include ovarian cancer and breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and CC disorders (e.g., infertility, disorders of pregnancy, anovulation, cpolycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine CC disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic cyspiratory cyndrome), inflammatory conditions (e.g., mastitis, oophoritis and cyspinitis), immune disorders (e.g., congenital and acquired ununodeficiencies, autoimmune oophoritis, systemic lipus crythematosus), conditions (e.g., anaemia), cardiovascular disorders, respiratory disorders (e.g., anaemia), cardiovascular disorders and urinary system disorders (ovarian antigen polypeptides and condulate ovarian antigen be used in screening for compounds which condulate ovarian antigen be used in screening for compounds which condulate ovarian antigen polypeptides may for individuals and in forensic analysis, and the dentification of individuals and in forensic analysis, and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABK44450-ABK46237 represent coding sequences of human colon tumour proteins of the invention.

Note: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but supplied by the European Patent Office.
                                                                                                                                                     1154
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New colon cancer polypeptides and polynucleotides, useful as vaccines, for diagnosing, preventing, and treating colon cancer, and as markers for the progression of cancer -

Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides are proteins in tumour cells. The compositions are useful for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         03-AUG-2000; 2000US-223283P

                                                                                                                                                   used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1154

                                                                                         The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer.
(d) assessing the efficacy of a therapy
in a patient;(e) selecting a composition for inhibiti

(I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a human eukaryotic initiation factor (eIF), designated heIF3), which is expressed in human dendritic cells. heIF3 has translation initiation factor activity. Also described in the present invention are methods for the preparation and detection of the heIF3 protein and nucleotide sequences. The present sequence encodes heIF3, as given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1221
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1148

                                                                                                                                                                                                                                                                                                                                                                                                                   В
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of this patention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                            1166
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynucleotide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.

ABK44450-ABK46237 represent coding sequences of human colon tumour proteins of the invention.

Note: With the exception of SEQ ID NO 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office.

MAY PLAY AN ESSENTIAL ROLE IN THE DEVELOPMENTAL CHANGE IN 5S RNA GENE EXPRESSION. INTERACTS WITH THE INTERNAL CONTROL REGION (ICR) OF APPROXIMATELY 50 BASES WITHIN THE 5S RNA GENES, IS REQUIRED FOR CORRECT TRANSCRIPTION OF THESE GENES BY RNA POLYMERASE III. ALSO BINDS THE TRANSCRIBED 5S RNA'S.

-I- SUBCELLULAR LOCATION: Nuclear.
-I- ALTERNATIVE PRODUCTS: 2 ISOFORMS; S-TFIIIA (IN SOMATIC CELLS) AND O-TFIIIA (IN OCCYTES); ARE PRODUCED BY ALTERNATIVE INITIATION.
-I- TISSUE SPECIFICITY: SYNTHESIZED IN OCCYTES AND, IN WICH LOWER LEVELS, IN SOMATIC CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    EMBL;

and characterization of TFIIIA from channel catfish oocytes.";
Gene 203:103-112(1997).

-i- FUNCTION: INTERACTS WITH THE INTERNAL CONTROL REGION (ICR)
APPROXIMATELY 50 BASES WITHIN THE 5S RNA GENES, IS REQUIRED
CORRECT TRANSCRIPTION OF THESE GENES BY RNA POLYMERASE III.
BINDS THE TRANSCRIPED 5S RNA'S (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TF3A_ICTPU
